CONTENT

The following dynamical system is called *discrete*:

$$\mathbf{x}_{i+1} = \mathbf{A}\mathbf{x}_i + \mathbf{B}\mathbf{u}_i \qquad (1)$$

Note that those:

- ■ have no derivatives in the equation;
- ■ are easily simulated.

The affine control for this system can be given as:

$$\mathbf{u}_i = -\mathbf{K}\mathbf{x}_i + \mathbf{u}_i^* \qquad (2)$$

Let us consider stability of the discrete dynamical system
$\mathbf{x}_{i+1} = \mathbf{A}\mathbf{x}_i$.

We will attack the problem in the same way as before, first
assuming that $\mathbf{A} = \mathbf{V}^{-1}\mathbf{D}\mathbf{V}$, where $\mathbf{D}$ is a diagonal matrix with
eigenvalues of $\mathbf{A}$ on its diagonal:

$$\mathbf{x}_{i+1} = \mathbf{V}^{-1}\mathbf{D}\mathbf{V}\mathbf{x}_i \tag{3}$$

Multiplying both sides of the equation by $\mathbf{V}$ and defining
$\mathbf{z}_i = \mathbf{V}\mathbf{x}_i$, we get:

$$\mathbf{V}\mathbf{x}_{i+1} = \mathbf{V}\mathbf{V}^{-1}\mathbf{D}\mathbf{V}\mathbf{x}_i \tag{4}$$

$$\mathbf{z}_{i+1} = \mathbf{D}\mathbf{z}_i \tag{5}$$

Now, considering $\mathbf{z}_{i+1} = \mathbf{D}\mathbf{z}_i$ we can see that the norm of the state $\mathbf{z}_i$ would not increase iff the norm of the elements of $\mathbf{D}$ (which as eigenvalues of $\mathbf{A}$) are smaller than 1.

Stability criterion

In general, discrete systems $\mathbf{x}_{i+1} = \mathbf{A}\mathbf{x}_i$ are stable as long as the eigenvalues of $\mathbf{A}$ are smaller than 1 by absolute value: $|\lambda_i(\mathbf{A})| \leq 1$, $\forall i$. This is true for complex eigenvalues as well.

Consider linear time-invariant autonomous system:

$$\dot{\mathbf{x}} = \mathbf{A}\mathbf{x} \qquad (6)$$

The time derivative $\dot{\mathbf{x}}$ can be replaces with a finite difference:

$$\dot{\mathbf{x}} \approx \frac{1}{\Delta t}(\mathbf{x}(t + \Delta t) - \mathbf{x}(t)) \qquad (7)$$

Note that we could have also used other definitions of a finite difference:

$$\dot{\mathbf{x}} \approx \frac{1}{\Delta t}(\mathbf{x}(t + 0.5\Delta t) - \mathbf{x}(t - 0.5\Delta t)) \qquad (8)$$

or

$$\dot{\mathbf{x}} \approx \frac{1}{\Delta t}(\mathbf{x}(t) - \mathbf{x}(t - \Delta t)) \qquad (9)$$

We can introduce notation:

$$\begin{cases} \mathbf{x}_0 = \mathbf{x}(0) \\ \mathbf{x}_1 = \mathbf{x}(\Delta t) \\ \mathbf{x}_2 = \mathbf{x}(2\Delta t) \\ ... \\ \mathbf{x}_n = \mathbf{x}(n\Delta t) \end{cases} \tag{10}$$

We say that $\mathbf{x}_i$ is the value of $\mathbf{x}$ at the time step i. Then the finite difference can be written, for example, as follows:

$$\dot{\mathbf{x}} \approx \frac{1}{\Delta t}(\mathbf{x}_{i+1} - \mathbf{x}_i) \tag{11}$$

We can rewrite our original autonomous LTI as follows:

$$\frac{1}{\Delta t}(\mathbf{x}_{i+1} - \mathbf{x}_i) = \mathbf{A}\mathbf{x}_i \qquad (12)$$

Isolating $\mathbf{x}_{i+1}$ on the left hand side, we get:

$$\mathbf{x}_{i+1} = (\mathbf{A}\Delta t + \mathbf{I})\mathbf{x}_i \qquad (13)$$

Or alternatively:

$$\frac{1}{\Delta t}(\mathbf{x}_{i+1} - \mathbf{x}_i) = \mathbf{A}\mathbf{x}_{i+1} \qquad (14)$$

Isolating $\mathbf{x}_{i+1}$ on the left hand side, we get:

$$\mathbf{x}_{i+1} = (\mathbf{I} - \mathbf{A}\Delta t)^{-1}\mathbf{x}_i \qquad (15)$$

Defining *discrete state space matrix* $\bar{\mathbf{A}}$ and *discrete control matrix* $\bar{\mathbf{B}}$ as follows:

$$\bar{\mathbf{A}} = \mathbf{A}\Delta t + \mathbf{I} \tag{16}$$

$$\bar{\mathbf{B}} = \mathbf{B}\Delta t \tag{17}$$

We get discrete dynamics:

$$\mathbf{x}_{i+1} = \bar{\mathbf{A}}\mathbf{x}_i + \bar{\mathbf{B}}\mathbf{u}_i \tag{18}$$

This way of defining discrete dynamics is called *zero order hold (ZOH)*.

Graphically, we can understand what zero order hold is, by comparing it to the first order hold:

Figure 1: Different types of discretization

Let the discrete state $\mathbf{x}_i$ correspond to continuous state $\mathbf{x}$ at the moment of time t_i. Then, we can say that the discretization is *exact* the following holds for any solution $\mathbf{x}(t)$

$$\mathbf{x}_0 = \mathbf{x}(t_0) \rightarrow \mathbf{x}_i = \mathbf{x}(t_i), \ \forall i \tag{19}$$

We can compute the exact discretization as follows:

$$\bar{\mathbf{A}} = e^{\mathbf{A}\Delta t} \tag{20}$$

$$\bar{\mathbf{B}} = \mathbf{B} \int_{t_0}^{t_0 + \Delta t} e^{\mathbf{A}s} ds \tag{21}$$
